

WELLHEAD INSPECTION PROGRAM

Let us help identify your wellhead components

OVERVIEW

Let us help you identify components on your wellheads that might have been overlooked the first time. During our inventory process on a customer's location, should we see anything that adversely affects the customer, we will report to the field supervisor or any person we believe needs to know.

Everything we report is strictly confidential between the customer and UWS, especially what items are on their wells, what their field may contain or anything the customer deems confidential, as well as schematics.

CASE STUDY

UWS recently helped one customer identify all components on their wellheads. We arrived at their location; we took pictures of the well sign, the entire wellhead, as well as problem areas; and we created drawings to identify the equipment in Visio.

Ultimately, the diagrams UWS put together were recognized as a "best practice" by the PHMSA Underground Gas Storage Inspectors at their most recent audit.
